Boundary Layer Meteorology Chapter 11 Convective mixed layer The mixed layer is so named because intense vertical mixing tends to leave conserved variables such as potential temperature and specific humidity nearly constant with height. Even wind speed and direction are nearly constant over the bulk of the mixed layer. The top of the whole convective mixed layer, z_i , is often defined as

Planetary boundary layer - Wikipedia

In meteorology the planetary boundary layer (PBL), also known as the atmospheric boundary layer (ABL), is the lowest part of the atmosphere. Its behavior is directly influenced by its contact with a planetary surface. On Earth it usually responds to changes in surface radiative forcing in an hour or less.

The research group investigates the dynamics of the atmospheric boundary layer over complex surfaces. A particular focus of our work is on the coherent structures in the convective and stable boundary layer and the coupling of the atmosphere with the underlying land surface.

The Atmospheric Boundary Layer - Met Office

The boundary layer is defined as that part of the atmosphere that directly feels the effect of the earth's surface. Its depth can range from just a few metres to

several kilometres depending on the local meteorology. Turbulence is generated in the boundary layer as the wind blows over the earth's surface and by thermals, such as those rising from land as it is heated by the sun, but also
