[DNA Electrophoresis | Thermo Fisher Scientific - CA](#)
What is DNA electrophoresis? Electrophoresis is a common lab technique used to identify, quantify, and purify nucleic acid fragments. Samples are loaded into wells of an agarose or acrylamide gel and subjected to an electric field, causing the negatively charged nucleic acids to move toward the positive electrode.

[Gel electrophoresis \(article\) | Khan Academy](#)

Gel electrophoresis is a technique used to separate DNA fragments according to their size. DNA samples are loaded into wells (indentations) at one end of a gel, and an electric current is applied to pull them through the gel.

[Gel Electrophoresis - Definition, Purpose and Steps ...](#)

Gel Electrophoresis is a procedure used in molecular biology to separate and identify molecules (such as DNA, RNA, protein, complexes) by size. The separation of these molecules is achieved by placing them in a gel made up of small pores and setting an electric field across the gel.

[Gel Electrophoresis Lab Report - Google Docs](#)

[Gel Electrophoresis Adventure](#) . Intro The final goal of this lab was to successfully measure the size of different samples of DNA by placing each sample into a well in agarose gel and running a current through a charged chamber.

[What is DNA Electrophoresis? \(with pictures\) - wisegeek.com](#)

DNA electrophoresis is a method used to sort DNA molecules by length. Pieces of DNA are suspended in a tray of gel and subjected to an electric field, which causes them to migrate toward one end of the tray.

[What is gel electrophoresis? | Facts | yourgenome.org](#)

Gel electrophoresis is a technique commonly used in laboratories to separate charged molecules like DNA, RNA and proteins according to their size. Charged molecules move through a gel when an electric current is passed across it.

[Gel electrophoresis Science Learning Hub](#)

Gel electrophoresis is used to separate macromolecules like DNA, RNA and proteins. DNA fragments are separated according to their size. Proteins can be separated according to their size and their charge (different proteins have different charges).

[Gel electrophoresis of nucleic acids - Wikipedia](#)

Nucleic acid electrophoresis is an analytical technique used to separate DNA or RNA fragments by size and reactivity. Nucleic acid molecules which are to be analyzed are set upon a viscous medium, the gel, where an electric field induces the nucleic acids (which are

negatively charged due to their sugar-phosphate backbone) to migrate toward the

Gel electrophoresis - Wikipedia

Gel electrophoresis is a method for separation and analysis of macromolecules (DNA, RNA and proteins) and their fragments, based on their size and charge.

Agarose Gel Electrophoresis for the Separation of DNA

...

Agarose gel electrophoresis is the most effective way of separating DNA fragments of varying sizes ranging from 100 bp to 25 kb 1. Agarose is isolated from the seaweed genera *Gelidium* and *Gracilaria*, and consists of repeated agarobiose (L- and D-galactose) subunits 2.
